
Free Download Photoprint 6 Rip S

MULTIPLE PRINTERS

With a RIP, you can run multiple printers from the same computer simultaneously, and without slowing anything down. You can process/print/prepare files for each printer to maximize production. A RIP will give you the ability to calibrate and profile each printer so you can achieve accurate and consistent colors between all connected printers. This is especially useful if you have 2 or more printers that all output the same media because instead of having to dedicate 1 printer to 1 job, you can run that job on any printer (or split it up and use all printers). The Linearization process accomplishes this by finding the original printing state of each printer (in terms of color output), thus "dialing in the printer" to its factory standard of output. Since normal use of a printer causes it to "drift" from its original state, the linearization process brings the printer back to where it needs to be. A real world comparison of this would be like adjusting the alignment of the tires on your car. Over time, wear and tear on a car's tires can cause the car to drift slightly to one side, but a tire alignment brings you back to the original state of the vehicle's steering, which is straight.
